

Beginning C++ Programming

What is Polymorphism?

The slide at about 8:20 should read as follows:

Polymorphism

A polymorphic example – Dynamic Binding

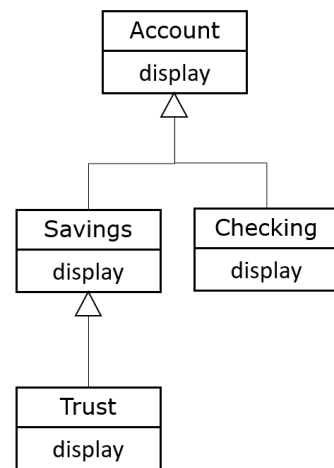

```
void display_account(const Account &acc)
{
    acc.display();
    // will always call the display method
    // depending on the object's type
    // at RUN-TIME!
}
```

```
Account a;
display_account(a);
```

```
Savings b;
display_account(b);
```

```
Checking c;
display_account(c);
```

```
Trust d;
display_account(d);
```

display method is virtual in Account

Thanks to Omri for pointing out the errors
